

Load required packages

```
install.packages("sqldf")  
library("sqldf")  
library(readxl) # only if reading excel xlsx file.
```

Importing data to environment

```
orders <- read_excel("/Users/shayne_lin/Desktop/work experience/UCSB/PSTAT10/LunchCost/orders.xlsx")
```

Selecting columns

1. SELECTing multiple columns
 - To select multiple columns from a table, simply separate the column names with **commas**
2. select all columns from a table
 - Typing out every column name would be a pain, so there's a handy shortcut: "SELECT *"

```
SELECT *  
FROM people
```
